# ANNUAL FINANCIAL REPORT HAMBLEN COUNTY, TENNESSEE

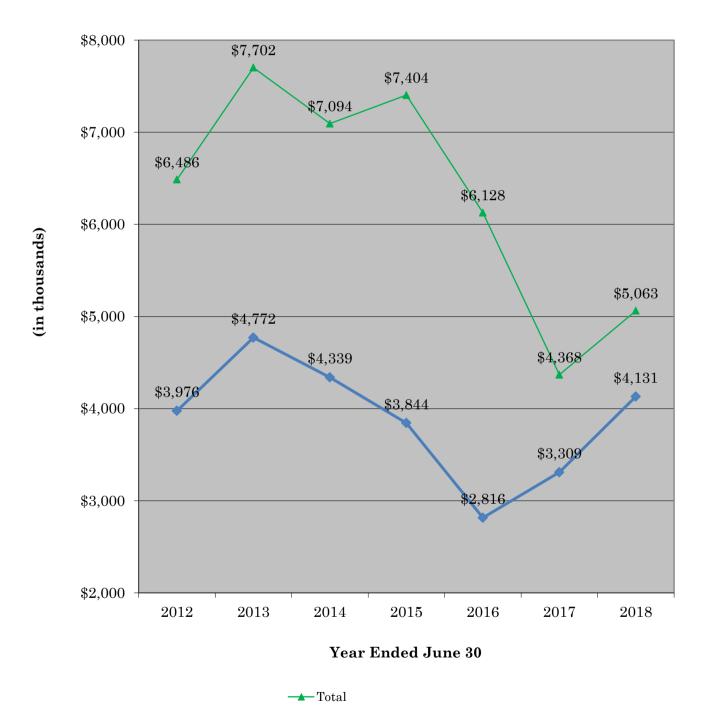

FOR THE YEAR ENDED JUNE 30, 2018

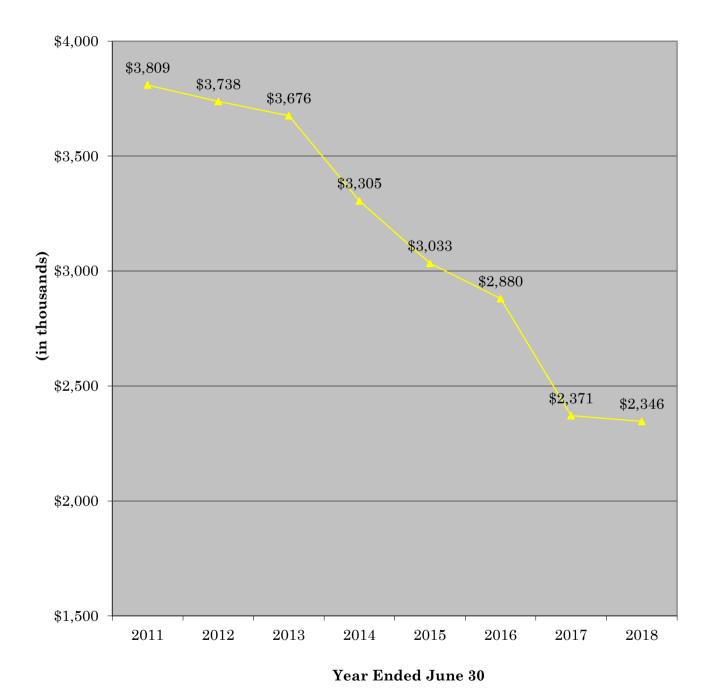

### **DIVISION OF LOCAL GOVERNMENT AUDIT**

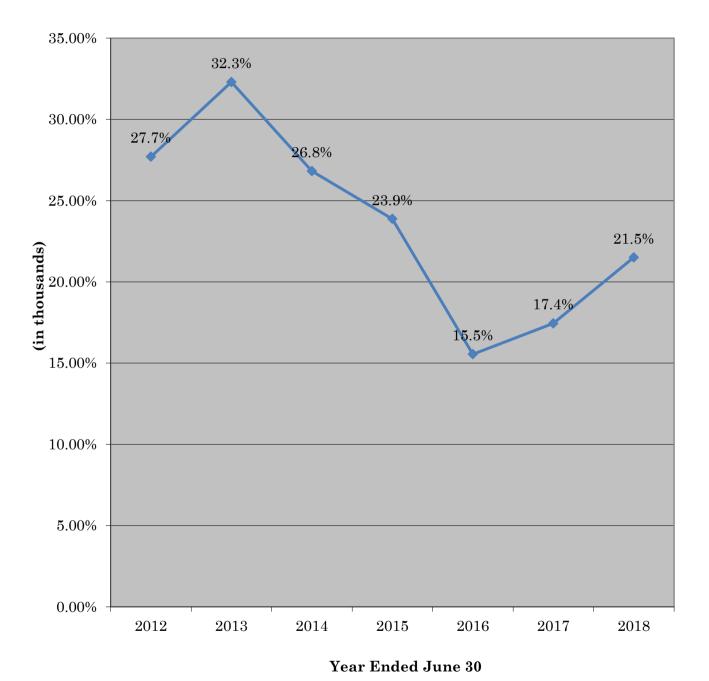

### General Fund Fund Balances

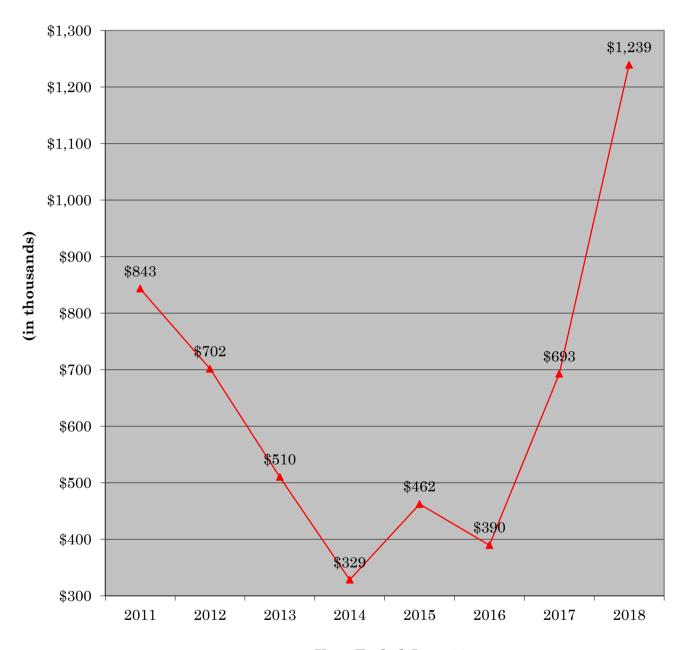

### Solid Waste/Sanitation Fund Total Fund Balance

# General Fund Percent of Unassigned Fund Balance to Expenditures

### Highway/Public Works Fund Total Fund Balance

Year Ended June 30

### Summary of Audit Findings

Annual Financial Report Hamblen County, Tennessee For the Year Ended June 30, 2018

### Scope

We have audited the basic financial statements of Hamblen County as of and for the year ended June 30, 2018.

#### Results

Our report on Hamblen County's financial statements is unmodified.

Our audit resulted in one finding, which we have reviewed with Hamblen County management. The detailed finding is included in the Single Audit section of this report.

#### **Finding**

The following is a summary of the audit finding:

#### OFFICE OF TRUSTEE

• Discrepancies in the operations of the Hamblen County Trustee's Office are currently being investigated.

### Fiscal Year 2018 Financial Audit

Hamblen County's financial statements received an **unmodified** report or a "clean opinion". This shows our financial statements can be presumed to be free from misstatements and that the underlying accounting records can be relied upon to support the financial statements.

Hamblen County Courthouse 511 West Second North Street Morristown, Tennessee 37814 (423) 586-6290

February 11, 2019

#### STATEMENT REGARDING INVESTIGATION BY COMPTROLLER'S OFFICE

The investigation by the Comptroller's Office relates to the timeliness of deposits made by the office. It is an on-going investigation and no conclusions have been reached. The Trustee's Office is fully cooperating with it.

John Baskette

Hamblen County Trustee

#### **DUTIES OF THE AUDIT COMMITTEE**

In Accordance with Tennessee Code Annotated (T.C.A.) Section 9-3-405 Section 5 the duties of the Audit Committee are:

- (a) To carefully review, upon completion of the county's annual audit, all audit findings in audit report and consult with the external auditors regarding any irregularities and deficiencies disclosed in the annual audit. The Audit Committee is empowered to meet with management to discuss audit findings and/or disagreements with the external auditors. The committee should satisfy itself that appropriate and timely corrective action has been taken by management to remedy any identified weaknesses. The committee should determine what corrective action, if any, should be recommended to the County Commission.
- (b) To consider the effectiveness of the internal control system, including information technology security and control, review the effectiveness of the system for monitoring compliance with laws and regulations, and review the process for communicating the county's ethics policies to county personnel and monitoring compliance therewith.
- (c) To establish a process by which employees, taxpayers, or other citizens may confidentially report suspected illegal, improper, wasteful or fraudulent activity under provisions of T.C.A. § 9-3-406.
- (d) To annually present a written committee report detailing how it discharged its duties and any committee recommendations to the full County Commission

#### FINANCE COMMITTEE

**Hamblen County Commission** 

From: Bill Brittain, County Mayor

Re:

**Building Demolition and Property Clearing Project** 

The contract to demolish the buildings and clear the trees and brush from the future jail expansion location is being re-bid because of an error in the original bid solicitation document.

The new bid opening is scheduled for Tuesday, March 19 at 2 p.m. The bid results will be presented to the commission at its meeting on Thursday, March 21st for the contract award.

Do not hesitate to contact me with any questions.

# Hamblen Marina, LLC

(DBA Hamblen County Boat Dock) PO Box 1194 Morristown, TN 37816

# SLIP RENTAL & MOORING AGREEMENT

Hamblen Marina LLC, a Tennessee Limited Liability Company hereinafter called "Hamblen Marina", desires to rent to:

(Tenant's Name)	s Department
(Tenant's Address)	pristoun, TN 37814
<u>423 - 586 - 3781</u> (Tenant's Phone Number)	Lease Signed
Seahunt Escape 175 (Boat Make)	Lease Term
(Boat Length)	
Boat Registration Number)	
Slip Number Assigned)	

(Hereinafter referred to as "Tenant") a boat slip at its marina facilities (hereinafter referred to as the "Marina") and tenant desires to rent a boat slip from Hamblen Marina. Thus, Hamblen Marina and Tenant covenant and agree as follows:

## WITNESSETH "Amendment"

1. Rental of Slip Hamblen Marina hereby rents to Tenant boat slip #
: Uncovers Houseboat Slip : Uncovered Ski/Fishing/Pontoon Boat Slip : Covered Ski/Fishing/Pontoon Boat Slip with Air Lift : Covered Ski/Fishing/Pontoon Boat Slip without Air Lift : 1 Boat per Slip (unless otherwise notated)
Commencement of Rental Term. The term of this rental agreement shall commence on 2019 (the "Commencement Date")
3. <u>Duration of Term</u> The term of the rental period shall be: (check and initial one)
: Duration of Term is through March 31, 2020
: Foryears from the Commencement Date (a "Multiyear Term")
: For the month-to-month starting on the Commencement Date (a "Month-to-Month Term")
4. Renewal: An Annual Term or Multiyear term shall not automatically renew. A Monthly Term shall automatically renew for the next succeeding month until such time as either party advises the other of intent to terminate the agreement. Such notice must be given more than 15 days from the end of the current month to be effective; otherwise it will cause the rental period to terminate on the last day of the next succeeding month.
5. Rental Amount and Payment: Rent shall be as follows:
<ul> <li>(a) For an Annual Term and Multiyear Term agreement the Tenant shall pay to Hamblen Marina, LLC the sum of \$ 100.00 per year, payable in installments of \$ 100.00 per month. #### AMENDMENT #4 2018-2019

The Hamblen County Board of Education requests approval from the Hamblen County Commission for Amendment #4 to the 2018-2019 General Purpose Budget. This amendment was approved by the Board of Education on February 12, 2019.

On June 28, 2018, the Hamblen County Commission approved a General Purpose Budget in the amount of \$88,962,319.30. Amendment #1 increased the budget to \$89,056,046.04. Amendment #2 increased the budget to \$89,061,922.68. Amendment #3 increased the budget to \$89,566,921.20. Amendment #4 will increase the budget to \$89,599,621.20.

This amendment does not affect the County's maintenance of effort.

Mr. Bill Brittain, County Mayor Hamblen County Courthouse 511 West Second North Street Morristown, TN 37814

RE: INVOICES FOR LEGAL SERVICES RENDERED ON BEHALF OF HAMBLEN COUNTY, TENNESSEE - FEBRUARY, 2019

Dear Bill:

Please find enclosed four (4) invoices representing legal services rendered on behalf of Hamblen County, Tennessee during the month of February, 2019.

As usual, one invoice covers our General/Miscellaneous File and three (3) invoices cover separate county departments.

Please review these invoices, and if you have any questions, please do not hesitate to contact me.

With best regards, I remain,

Christopher P. Caps/alg

Very truly yours,

Christopher P. Capps

# ANNUAL OPERATIONS REPORT

2018

# Hamblen County Emergency Communications District

The mission of the Hamblen County Emergency Communications District (E-911) is to aid and assist in the rapid and accurate collection, exchange, and dissemination of information relating to emergencies and other vital public safety functions.

# ANNUAL OPERATIONS REPORT

#### HAMBLEN COUNTY EMERGENCY COMMUNICATIONS DISTRICT

1 February 2019

I am very pleased to present the Fifth Annual Operations Report of the Hamblen County Emergency Communications District.

Following you will find information regarding the over 74,000 calls for service and over 143,000 telephone calls handled by Hamblen County ECD last year. This year's Report has been expanded to include additional charts which better relate the historical data/trends of our client agencies.

Also included is data relating to our performance under NFPA 1221, the Standard for the Installation, Maintenance, and Use of Emergency Services Communications Systems. NFPA 1221 was revised in 2016; with changes occurring in Section 7.4.2 as it relates to the times allotted for the processing and dispatching of specific call types, and this year's Report continues to reflect our level of compliance with the updated Standard.

Hamblen County ECD has performed at a superior level in our efforts to lower the response times of our client agencies; as is shown by our average times for call processing and dispatching for all the entities we serve:

2018 Average Times for Call Processing & Dispatching				
Morristown Police Department	:51			
Hamblen Co. Sheriff's Department	:53			
Morristown-Hamblen EMS	:31			
Morristown Fire Department	:36			
Volunteer Fire Departments	:40			

As referenced by our NCIC Activity Report, Hamblen County ECD serves as the TBI's Terminal Agency and we processed over 62,800 entries and queries in 2018.

In order to continue to serve our jurisdiction and our client agencies with the excellent service they are accustomed to, we understand that a robust training program is essential. In 2018, Hamblen County ECD employees completed a combined 859 hours of training.

This Report will continue to evolve as we face new challenges and ever-changing innovations. Meeting our goals with efficiency and professionalism will always be our aim.

I hope that you will find this information useful.

Eric Carpenier, C

**Executive Director**

# Hamblen County Emergency Communications District

### Fact Sheet - 2018

### **Basic Facts**

- Hamblen County 161 sq. miles, population of 63,400
- Consolidated Center, answering all 9-1-1 & non-emergency calls for Hamblen County and City of Morristown
- Dispatch calls for service for ten (10) departments:
  - Morristown Police Department
  - Hamblen County Sheriff's Department
  - Morristown Fire Department
  - Hamblen County Volunteer Fire Departments (4)
  - Morristown-Hamblen EMS
  - Morristown Emergency Rescue Squad
  - Emergency Management Agency
- Redundant backup center, fully equipped
- NCIC Terminal Agency for Hamblen County

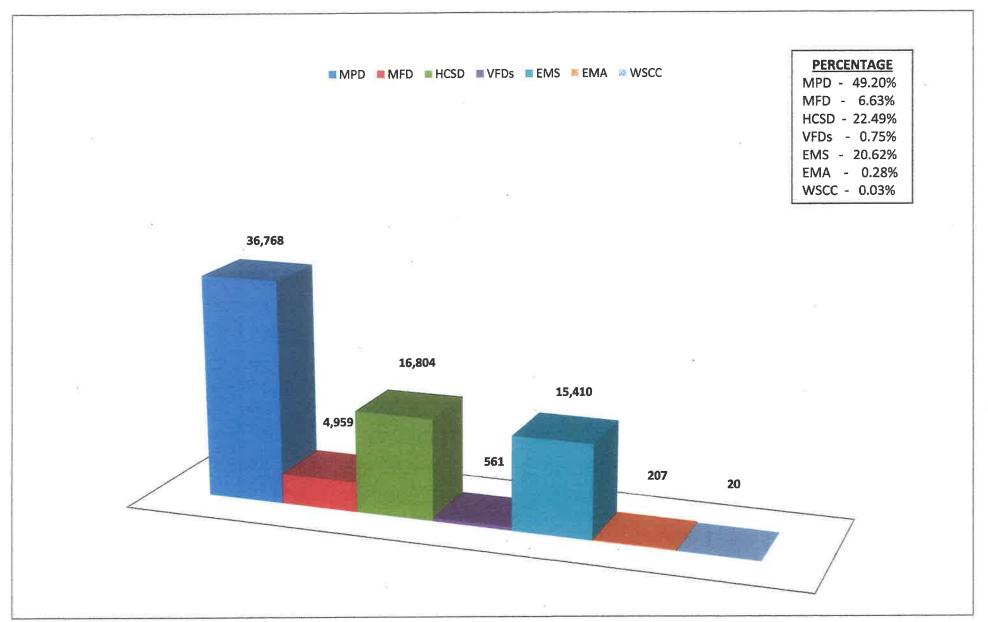

### **Call Statistics**

- Processed 143,012 telephone calls; approx. 11,918 per month
- Dispatched 74,729 calls for service
- Average answer time for 9-1-1 calls: 97% < 10 seconds</li>79% < 5 seconds</li>
- Average time for call processing and dispatching was 42 seconds
- All telecommunicators cross trained as both call takers and dispatchers; handling any type of call – Police, Fire, or EMS

### Systems / Applications

- Global Software / Cisco CAD v.2015.4.49
- Airbus Sentinel Patriot VolP Telephone Controller v.3.3.0 Build177
- Avtec Scout IP Radio System v.3.5.15.3
- DSS Corp. / Equature Voice Logger/Recorder v.1.73.1.0

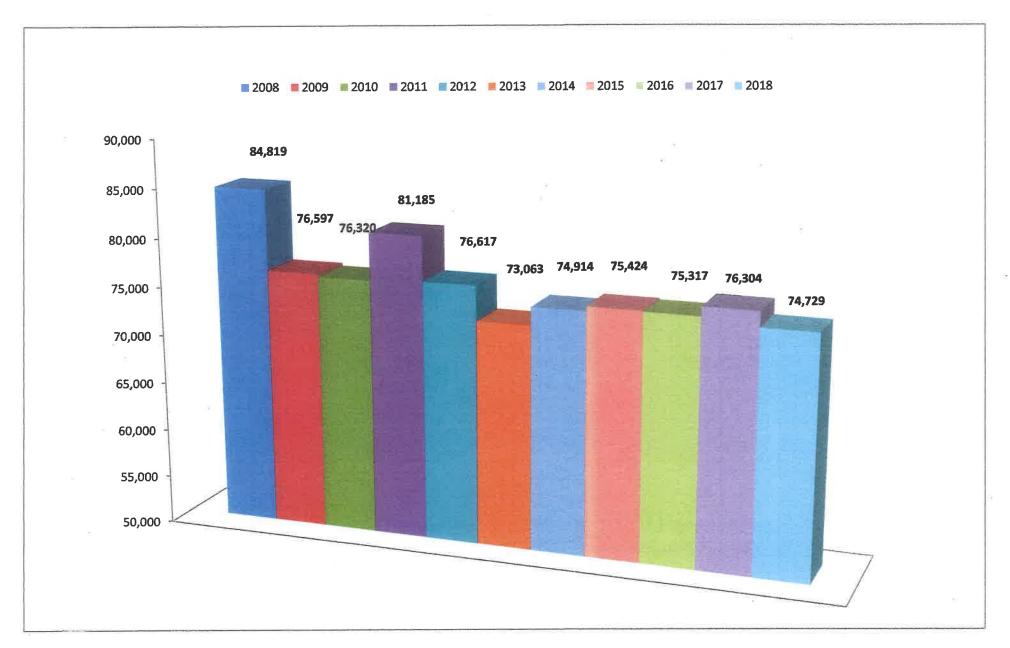

# 2018 Calls For Service 74,729

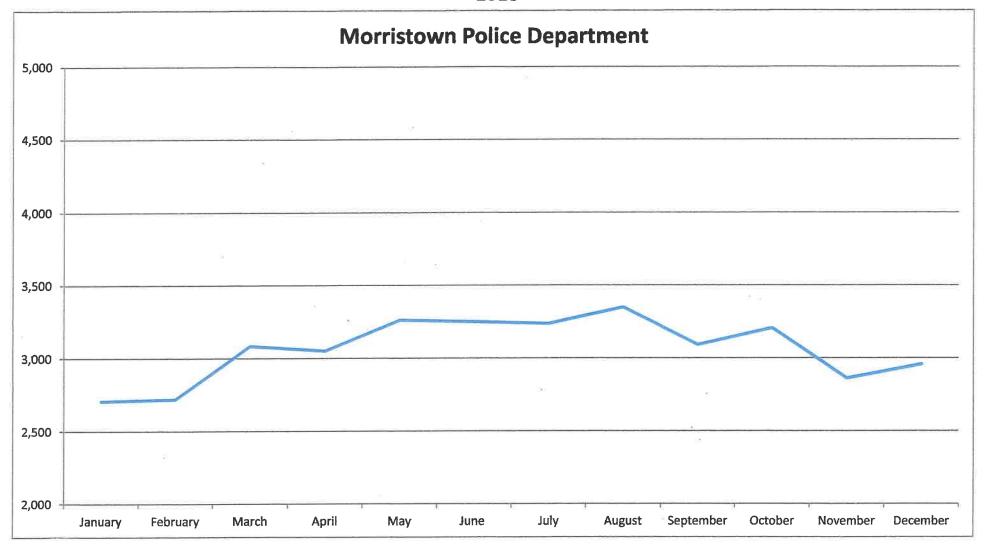

NOTICE: Law Enforcement Calls for Service include officer initiated activities (i.e. – traffic stops, investigations of suspicious individuals, etc.).

- 5. Items of Interest (No Action Necessary) -Chairman Thomas Doty
  - a. None
- **6.** Adjournment Chairman Thomas Doty

Upon initial employment, all employees are required to attest that they are lawfully eligible to work in the United States. Employees are further required to supply the Elected Official or Department Head copies of documents proving this eligibility.

A valid Driver's License and a Social Security card are among the acceptable forms of proof of eligibility. Further information is available on the I-9 Form.

### 1.2 WORKPLACE VIOLENCE PREVENTION POLICY

Hamblen County is committed to providing a safe, healthy, and secure work environment. The presence of weapons, violence, threats of violence, and other disruptive behavior in the workplace is inconsistent with this commitment and will not be tolerated.

While Hamblen County has no intention of intruding into the private lives of its present or potential employees, Hamblen County expects all employees to report to work without possessing weapons and to perform their jobs without violence toward any other individual. Accordingly, this policy establishes Hamblen County's zero-tolerance for violence, as well as sets forth a plan to resolve such incidents if necessary.

This policy applies to anyone on Hamblen County government property, including but not limited to all employees, contractors, volunteers, interns, temporary employees, board members, and visitors.

Threats, threatening behavior, or acts of violence against employees, visitors, guests, or other individuals on Hamblen County property will not be tolerated. Any person who makes threats, exhibits threatening behavior, or engages in violent acts on Hamblen County property shall be removed from the premises as quickly as safety permits, and shall remain off Hamblen County premises pending the outcome of an investigation.

Violation of this policy shall be considered misconduct and may lead to disciplinary action up to and including termination and/or appropriate legal action if the violator is an employee.

Violation of this policy by **non-employees** may result in suspension and/or termination of any business relationship, appropriate legal action, or other disciplinary response deemed appropriate. The County Mayor in unusual circumstances may grant exceptions from this policy.

#### **DEFINITIONS:**

- 1. Threat: The expression of intent to cause physical or mental harm. An expression constitutes a threat without regard to whether the party communicating the threat has the present ability to carry it out and without regard to whether the expression is contingent, conditional, or future.
- 2. <u>Physical attack:</u> Unwanted or hostile physical contact such as hitting, fighting, pushing, shoving, or throwing objects.
- 3. Weapon: Includes an explosive device or its component parts or an explosive weapon principally designed, made, or adapted for delivering or shooting an explosive weapon projectile. For this application, a firearm includes a machine gun a rifle, short-barrel rifle, shotgun, or-handgun. Also, includes a switchblade knife or any other type of knife with illegal blade length, brass knuckles, or any other implement for infliction of bodily injury, serious bodily injury, or death which has no common lawful purpose or which is an illegal weapon under TN Code.

#### (a) Permitted Firearm and Ammunition

- Firearm and ammunition belonging to an employee, of which the employee
  has a valid handgun carry permit, that the employee transports and stores in
  the employee's vehicle while on company property and parked in an
  authorized employee parking area is permitted.
- While the employee is in the employee's vehicle, the employee's firearm and ammunition shall be kept out of plain sight.
- When the employee is not in the employee's vehicle, the employee's firearm and ammunition shall be out of plain sight and locked within the trunk or interior of the vehicle.
- Any vehicle with a firearm stored inside must be locked at all times when the vehicle is vacant of the employee.
- Hunting weapons of any type are allowed as long as the owner/employee is compliant with TWRA regulations and the supervisor is advised of intent to carry hunting weapons in his/her vehicle.

#### (b) Prohibited Weapons

- All firearms and ammunition in the possession of an employee without such employee having a valid permit for such firearms.
- All firearms and ammunition transported and stored in violation of this policy, regardless of employee having a permit to carry the firearm.
- Any weapons prohibited by state and/or federal statute,
- · Employees are strictly prohibited from the exercise of trading, showing,

swapping or sharing firearms with another person while on County property or using a county vehicle.

- 4. On the Work Site: Includes all property owned or occupied by Hamblen County (including County job sites) or in a County vehicle. However an employee may store a permitted firearm and ammunition in a County vehicle if the employee has notified his/her supervisor.
- 5. <u>Possession</u>: Shall include, but is not limited to, the presence of a weapon on the employee or in vehicles lunch boxes, lockers, tool kits, bags, purses, cabinets, offices, etc.

6. **Property damage**: Intentional damage to property which includes property owned by Hamblen County, employees, visitors, or vendors.

### GENERAL EXAMPLES OF WORKPLACE VIOLENCE:

- 1. All threats or acts of violence on Hamblen County property, regardless of the relationship between the agency and the parties involved in the incident.
- 2. All threats or acts of violence not occurring on Hamblen County property but involving someone who is acting in the capacity of a representative of Hamblen County.
- 3. All threats or acts of violence not occurring on Hamblen County property but involving a Hamblen County employee if the behavior affects the legitimate interests of the county government.
- 4. Any threats or acts resulting in the conviction of an employee or agent of Hamblen County, or an individual performing services on Hamblen County's behalf on a contractual or temporary basis, under any criminal code provision relating to threats or acts of violence that adversely affect the legitimate interests and goals of the county government.

### SPECIFIC EXAMPLES OF WORKPLACE VIOLENCE:

- 1. Hitting or shoving an individual.
- 2. Threatening to harm an individual, family members, friends, or associates.
- 3. Damaging another person's property.
- 4. The intentional destruction or threat of destruction of property owned, operated, or controlled by Hamblen County government.
- 5. Making harassing or threatening telephone calls.

Page 9 of 91

### SECTION VI DISCIPLINARY PROCEDURES

### 6.0 POLICY

Regulations for the acceptable conduct of employees are necessary for the orderly operation of the county's business and for the benefit and protection of the rights and safety of all employees. Certain regulations, and others that may be established from time to time, and the procedures for disciplinary action are published to promote understanding of what is considered unacceptable conduct and to provide for consistent action in the event of violations.

The County absolutely reserves the right to terminate an employee at any time for any reason or no reason at all, every County employee being an employee-at-will.

### 6.1 REASONS FOR DISCIPLINE

An employee may be disciplined if any of the following charges are substantiated. The following list is **NOT** intended to cover every work situation but is an **EXAMPLE** of the types of charges that may result in appropriate disciplinary action. Hamblen County's right to discipline or dismiss employees shall **NOT** be limited to the following list.

- Possessing firearms on Hamblen County property during working hours Violating the Workplace Violence Prevention Policy. (Section 1.2):
- Reporting to work under the influence of alcohol or drugs.
- Possessing, distributing, or using alcohol or drugs on Hamblen County property during working hours.
- Giving false statements on the employment application.
- Intentionally reporting incorrect work schedules or falsifying records.
- Stealing from fellow employees, the company, or Hamblen County residents.
- Refusing to do assigned work (insubordination).
- Willfully destroying or abusing Hamblen County property.
- Using abusive and/or threatening language.
- Instigating or participating in a fight on Hamblen County property.
- Being absent from work without notifying immediate supervisor.
- Sleeping during working hours.
- Leaving work during working hours without authorization from immediate supervisor (except during lunch period).
- Being habitually tardy without reasonable cause as determined by the immediate supervisor. Habitually tardy is defined as four times in a six-month period.
- Excessive Absenteeism.
- Posting, removing, and/or tampering with official bulletin boards without proper authorization.

## Hamblen County Government JAIL STUDY COMMITTEE

Monday, March 11, 2019
Following the Adjournment of the Personnel Committee
Hamblen County Courthouse Large Courtroom

### **AGENDA**

- 1. Call to Order Chairman Taylor Ward
- 2. Visitors Wishing to Address the Committee Chairman Taylor Ward (Visitors will be allotted 5 minutes to speak)
- 3. Old Business Chairman Taylor Ward
  - a. Preliminary Geotechnical Testing of Future Jail Site-Mayor Bill Brittain
- 4. New Business Chairman Taylor Ward
  - a. Contract Negotiations with Moseley Architects-Member Scotty Long
- 5. Items of Interest (No Action Necessary) Chairman Taylor Ward
  - a. None
- 6. Adjournment Chairman Taylor Ward

**REMINDER** – Next Jail Study Committee Meeting Thursday, March 14th at 5:00 p.m. in the Large Courtroom

March 7, 2019

To:

**Jail Study Committee** 

**Hamblen County Commission** 

From: Bill Brittain, County Mayor 515

Re:

Preliminary Geotechnical Testing of Future Jail Site

GEO Services of Knoxville, Tennessee delivered by email on February 27, 2019 the geotechnical study of the Allison Street property identified as the future site of the county jail expansion.

The study found that the soil in the area is typical of soil in Hamblen County, and that it would support either a two or three story jail facility.

Senior Geotechnical Engineer Matt Haston said the site consists primarily of natural soil and not much fill dirt. The testing found some soft places that are common for East Tennessee. He said the foundation system design will depend on the size of structure the County decides to build.

The full report accompanies this memorandum and will be forwarded to the design team at the appropriate time.

Subject: REPORT OF PRELIMINARY GEOTECHNICAL EXPLORATION

**Hamblen County Jail Project** 

Morristown, Tennessee

GEOServices Project No. 21-19070

### Dear Mayor Brittain:

We are submitting the results of the preliminary geotechnical exploration performed for the subject project. The geotechnical exploration was performed in accordance with our Proposal Number 11-19024 dated January 11, 2019 and as authorized by your Purchase Order Number 1011901097. The following report presents our findings and recommendations for the proposed project. Should you have any questions regarding this report, or if we can be of any further assistance, please contact us at your convenience.

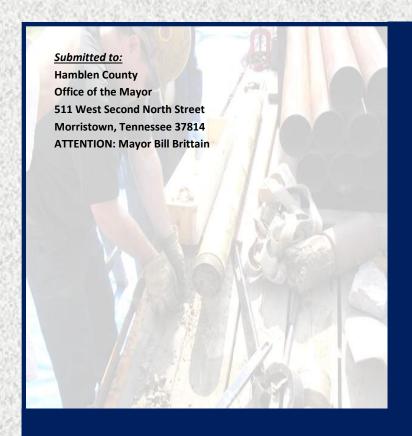

Sincerely,

**GEOServices, LLC** 

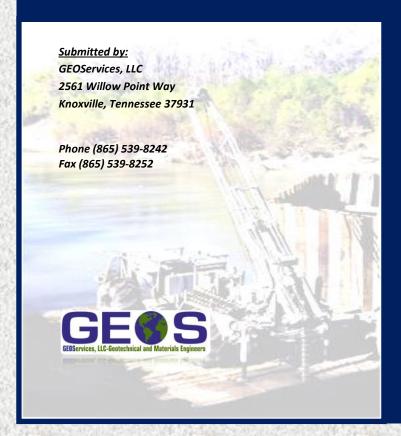

Matthew B. Haston, P.E. Senior Geotechnical Engineer TN 109,269

W. Ros Kingery III, P.E. Vice President

## 1.0 INTRODUCTION

## 1.1 PURPOSE

The purpose of this preliminary geotechnical exploration was to obtain information regarding site subsurface conditions and assess the suitability of the site for future development. When specific project details concerning building locations, types, foundation loads and site grades are developed, subsequent and more detailed exploration and analysis will be necessary to provide the final geotechnical design parameters.

#### 1.2 PROJECT AND SITE DESCRIPTION

Project information was provided during a meeting with you on January 10, 2019. We were also provided conceptual drawings showing the various alternatives for the project.

The project will consist of the construction of a new Hamblen County Jail and Justice Center. The provided information indicates that the new complex will include provisions for 480 jail beds, two courtrooms, a multipurpose room, clerk's office, judge's chambers and meeting rooms. Presently, two concepts are being evaluated for the project. Concept 1 includes the construction of a new three-story, concrete framed structure on a site located south of the existing Justice Center. This site is generally bounded to the west by Allison Street, to the east by Esco Way, and to the south by West 3<sup>rd</sup> North Street. We understand Hamblen County presently owns the property associated with the Concept 1 alternative.

The Concept 1 site is presently occupied by residential structures and associated outbuildings to the west and south, with the remaining portion of the site covered by grasses and mature to sampling trees. Site grades slope downward from south to north across this site, with an estimated topographic relief of about 10 to 20 feet across the site.

Concept 2 includes the construction of a two-story structure in the area south of the existing Justice Center extending westward into Allison Street and the adjacent properties to the west. We understand that Hamblen County does not presently own the properties in the area west of Allison

Street and east of North Jackson Street where the Concept 2 structures may be located. The area between Allison Street and North Jackson Street is presently occupied by one to two-story commercial buildings and the Morristown Emergency Rescue Squad building. Site grades in the western portion of the Concept 2 site area slope downward from south to north, with an estimated topographic relief of about 10 feet.

The project is in the preliminary design phase and detailed information regarding structural locations, types, or finished grades has not yet been determined. Based on our experience with similar construction, we anticipate maximum column and continuous wall foundation loads will range from 150 to 300 kips and 4 to 6 kips per linear foot, respectively, depending upon the final building type and design.

#### 1.3 SCOPE OF STUDY

This preliminary geotechnical exploration involved a site reconnaissance, field drilling, laboratory testing and engineering analysis. The following sections of this report present discussions of the field exploration, site conditions, and conclusions and recommendations. Following the text of this report, Appendix A presents figures and test boring records.

The scope of our geotechnical engineering services did not include an environmental assessment for determining the presence or absence of wetlands, or hazardous or toxic materials in the soil, bedrock, surface water, groundwater, or air, on, or below, or around this site. Any statements in this report or on the boring logs regarding odors, colors, and unusual or suspicious items or conditions are strictly for informational purposes.

## 2.0 EXPLORATION AND TESTING PROGRAMS

#### 2.1 FIELD EXPLORATION

Subsurface conditions were explored by drilling twelve (12) widely spaced soil test borings. The borings were located in the field by GEOServices personnel based upon our understanding of the area

which is under consideration to be developed. Drilling was performed during the period from February 11 through February 15, 2019 by our subcontractor. The borings were advanced using 2<sup>1</sup>/<sub>4</sub>-inch inside diameter hollow stem augers (HSA) and a Geoprobe<sup>®</sup> 7730DT track-mounted drill rig.

The depths in this report reference the ground surface at the site that existed at the time of the exploration. The approximate locations of the soil test borings are shown on Figure 2. Detailed logs for soil test borings can be found in Appendix A of this report.

Within each soil test boring, Standard Penetration Testing (SPT) and split-spoon sampling were performed at  $2\frac{1}{2}$  foot intervals in the upper 10 feet and at 5 foot intervals thereafter. The drilling was performed in accordance with ASTM D 6151 (hollow stem auger drilling). SPT and split-spoon sampling were performed in accordance with ASTM D 1586.

In split—spoon sampling, a standard 2-inch O.D. split-spoon sampler is driven into the bottom of the boring with a 140-pound hammer falling a distance of 30 inches. The number of blows required to advance the sampler the last 12 inches of the standard 18 inches of total penetration is recorded as the SPT (N-value). These N-values are indicated on the boring logs at the testing depth and provide an indication of the consistency of the cohesive soils.

#### 2.2 LABORATORY TEST PROGRAM

After completion of the field drilling and sampling phase of this project, the soil samples were returned to our laboratory where they were visually classified in general accordance with the Unified Soil Classification System (USCS – ASTM D 2487) by a GEOServices geotechnical professional. Select samples were then tested for moisture content (ASTM D 2216), Atterberg limits (ASTM D 4318), and unconfined compressive strength (ASTM D 2166). The laboratory test results are further discussed in the following sections of this report and a summary is provided in Appendix B.

## 3.0 SUBSURFACE CONDITIONS

#### 3.1 GEOLOGIC CONDITIONS

The project site lies within the Appalachian Valley and Ridge Physiographic Province. The Province is characterized by elongated, northeasterly-trending ridges formed on highly resistant sandstone and shale. Between ridges, broad valleys and rolling hills are formed primarily on less resistant limestone, dolomite, and shale.

Published geologic information indicates that the site is underlain by the Kingsport formation of the Knox Group. The Kingsport formation consists of siliceous dolomite with some limestone beds. These rock units weather to produce a thick residual clay overburden. Silica in the form of chert is resistant to weathering and is scattered in various quantities throughout the clay residuum.

Since the bedrock underlying this site contains carbonate rock (i.e. limestone/dolomite), the site is susceptible to the typical carbonate hazards of irregular weathering, cave and cavern conditions, and overburden sinkholes. Carbonate rock, while appearing very hard and resistant, is soluble in slightly acidic water. This characteristic, plus differential weathering of the bedrock mass is responsible for the hazards. Of these hazards, the occurrence of sinkholes is potentially the most damaging to overlying soil-supported structures. Sinkholes occur primarily due to differential weathering of the bedrock and flushing or raveling of overburden soils into the cavities in the bedrock. The loss of solids creates a cavity or dome in the overburden. Growth of the dome over time or excavation over the dome can create a condition in which rapid, local subsidence or collapse of the roof of the dome occurs. Such a feature is termed a sinkhole.

The process of bedrock solutioning including the formation of bedrock pinnacles, slots, fissures, caves, and sinkholes has been occurring for a long period of time. The result of this solutioning is evidenced by the undulating topography of present day East Tennessee. Such topography is often referred to as "Karst" topography which is a term used to describe landforms, geologic features, and subsurface conditions resulting from the solutioning of carbonate bedrock. Some of the features associated with karst topography include internally drained depressions (closed depressions), springs, sinking creeks, caves, and underground springs.

Closed depressions are sinkholes which formed during the geologic past and have subsequently filled naturally with soil by the processes of running water or gravity. Closed depressions are indicated on United States Geologic Survey (USGS) topographic maps by a hatched contour interval. We observed several closed depressions on the published USGS (Morristown, TN Quadrangle) topographic map within the immediate vicinity of this site. Figure 1 in Appendix A shows a section of the USGS topographic map in the site vicinity.

Indications of karst activity can also be identified in the subsurface conditions revealed by the soil test borings drilled as part of this preliminary exploration. A common indicator of karst in the borings is the presence of a zone of soft soil overlying bedrock. This zone of soft soil above the bedrock surface and between pinnacles in the bedrock is commonly referred to as "epikarst". Borings B-3, B-4, B-6, B-7, B-10 and B-11 drilled as part of this exploration encountered indications of an epikarst zone.

A certain degree of risk with respect to sinkhole formation and subsidence should be considered at all sites located within geologic areas underlain by potentially soluble rock units. It is our opinion that the risk of sinkhole development at this site is no greater than at other sites located within similar geologic settings which have been developed successfully, including the existing site development. However, the owner must be willing to accept a moderate to high risk of sinkhole development at this site. A discussion of alternatives which may be used to help reduce the risk of sinkhole development are provided in this report.

### 3.2 SUBSURFACE CONDITIONS

The following subsurface description is of a generalized nature to highlight the subsurface stratification features and material characteristics at the boring locations. The boring logs included in Appendix A of this report should be reviewed for specific information at each boring location. Information on actual subsurface conditions exists only at the specific boring locations and is relevant only to the time that this exploration was performed. Variations may occur and should be expected at the site.

## Surficial

The borings of this preliminary exploration encountered 6 to 12 inches of topsoil and/or crushed stone at the ground surface.

## Fill Soil

Fill soils were encountered to depths of 3 feet below the existing ground surface in borings B-4, B-7, B-10 and B-12. Fill is a material which has been transported and placed by man. The samples of fill recovered were manually classified as varying shades of brown fat (high plasticity) clay which contained some topsoil and rock fragments. The SPT N-values within the fill ranged from 0 (shown as W.O.H for Weight Of Hammer on the boring logs) to 11 blows per foot (bpf). The natural moisture contents of the samples of fill subjected to laboratory testing ranged from 20.9 to 28.2 percent.

#### Residual Soil

Residual soils were encountered underlying the topsoil and fill in each of the borings. Residual soils are formed from the in-place weathering of the parent bedrock. The residual soil was manually classified as reddish brown, yellowish brown, and reddish yellow lean (lower plasticity) to fat (high plasticity) clay. The lean clay zones were typically encountered at depth and contained sand, dolomite or limestone fragments, generally overlying refusal likely from weathered bedrock material. The residual soils contained varying amounts of chert fragments.

The SPT N-values within the residual soil ranged from 0 to 46 blows per foot (bpf). These N-values correspond to soil consistencies of very soft to hard. The majority of the soft soils were encountered at depths ranging from 12 to 32 feet below the ground surface and represent the previously described epikarst zone. We did encounter some shallow soft residual soils to depths of about 3 feet in borings B-6 and B-11.

The results of moisture content testing performed on selected residual soil samples indicated insitu moisture contents ranging from 28.4 to 58.4 percent. Atterberg limits testing of the residual soil samples indicated Liquid Limit (LL) values of 55 to 86 percent and Plasticity Index (PI) values

of 32 to 55 percent. The samples tested may be classified as lean fat clays based on the USCS and results of the plasticity testing alone.

## Auger Refusal

Materials sufficiently hard to cause refusal to the power auger used to drill the borings were encountered in borings B-1, B-3, B-5, B-7, and B-9 at depths ranging from 29.2 to 66.7 feet below the existing ground surface. The remaining borings were terminated at the predetermined depths of 30 feet below the existing ground surface. Auger refusal is a designation applied to materials that cannot be penetrated by the power auger used to drill the borings. Rock coring to explore the composition and continuity of the refusal materials was beyond the scope of this preliminary exploration.

#### **Ground Water**

Groundwater was encountered at a depth of 38.5 feet below the existing ground surface in boring B-7. No water was encountered in the remainder of the borings at the time of drilling. The borings were backfilled upon completion in consideration of safety. Ground water levels may fluctuate due to seasonal changes in precipitation amounts, construction activities in the area, and/or the level of nearby water features. The ground water information presented in this report is the information that was collected at the time of our field activities.

*Table 1 – Summary Information* 

Boring	Fill Depth (ft)	Epikarst Zone Top (ft)	Auger Refusal (ft)
B-1	-	-	33.5
B-2	-	-	-
B-3	-	22	34.3
B-4	3	27	-
B-5	-	-	29.2
B-6	-	12	-
B-7	3	32	66.7
B-8	-	-	-
B-9	-	-	29.3
B-10	3	27	-
B-11	-	22	-
B-12	3	-	-

#### 4.0 CONCLUSIONS AND RECOMMENDATIONS

## **4.1 SITE ASSESSMENT**

The borings of this exploration encountered a surficial veneer of topsoil or crushed stone which was underlain by isolated zones of fill soil and more commonly, residual soil. The fill soils were generally encountered to depths of about 3 feet below the ground surface. Some shallow zones of soft residual soils were encountered in the borings as well. The majority of the residual soils were stiff, or better, consistency except in the previously described epikarst zone. The site appears suitable for development of the proposed jail and justice center; however, some challenges exist such as the upper zones of fill soils and soft residuum, deeper zones of soft soil and the moderate to high potential for sinkhole development.

Typically, stiff residual soils can support structures having individual column loads of less than about 200 kips using a system of shallow foundations while maintaining foundation settlements to an acceptable level. Based on our understanding of the project information, it will likely be possible to support the proposed two-story structures using shallow foundations bearing in the stiff residual soils. The challenges associated with shallow foundation support of the proposed two-story structures include the presence of existing fill, soft residual soils and the risk of sinkhole induced structural distress.

Undercutting and replacement is a common shallow foundation support correction alternative where relatively shallow zones of existing fill or soft residual soils are encountered. This method of foundation support correction is performed routinely by contractors at the time of construction based on observations and testing by the geotechnical engineer.

If site grades are established such that significant earthwork grading is required, then more extensive zones of soft soil may be encountered. These more extensive zones of soft soil (epikarst) are not easily dealt with by conventional means at the time of construction. We therefore recommend that the proposed finished grades be carefully evaluated with the information from

this preliminary exploration with respect to the softer soils at depth. The top of the epikarst zone ranged from 12 to 32 feet below the existing ground surface in the borings of this preliminary exploration.

Structures supported using shallow foundations are at risk of sinkhole induced structural distress. This occurs when a sinkhole forms underlying the soil supporting the shallow foundation thereby compromising the foundation. While uncommon, repair to a structure which has been distressed as a result of sinkhole activity can be disruptive and costly once the structure is in service. Given the moderate to high risk of sinkhole development at this site, we recommend that consideration be given to measures to reduce the risk of sinkhole development in structural areas; especially if the structures are supported using shallow foundations. We have provided a discussion of measures to reduce the risk of sinkhole development later herein.

Heavily-loaded buildings which support column loads of more than 200 kips (similar to the proposed multi-story, concrete-framed structure) or more lightly-loaded structures which by necessity bear in the zones of extensive soft soils at depth will likely require deep, rock-bearing foundations for support. Drilled shafts and micropiles are two commonly used deep foundation support alternatives which are discussed later in this report.

We note that additional geotechnical exploration, laboratory testing, and engineering analysis will be required to develop the final geotechnical recommendations and parameters for design once the project design has been further developed.

### **4.2 SITE PREPARATION**

## 4.2.1 Subgrade

Demolition of the existing structures should include the complete removal of below grade items (including concrete foundations, slabs, and walls) and pavements (including basestone). Existing basements or pits, if present, should be excavated with a 2H:1V side slope and the excavation backfilled using structural soil fill or compacted dense graded aggregate. Additionally, utilities to

be abandoned should be completely removed and their trenches backfilled using structural soil fill. If utilities are to remain in use, they should be rerouted outside of the proposed building areas.

Site stripping within the proposed construction areas (building and pavement) should include the removal of vegetation, topsoil, wood, mulch, rock fragments greater than 6 inches, asphalt, gravel, concrete, and other debris. The stripping operations should extend a minimum of 5 feet beyond the limits of proposed pavement areas and 10 feet beyond building footprints.

After the completion of stripping operations and excavation to reach the planned subgrade elevation, we recommend that the subgrade be proofrolled with a fully-loaded, tandem-axle dump truck or other pneumatic-tired construction equipment of similar weight. The geotechnical engineer or his representative should observe proofrolling. Areas judged to perform unsatisfactorily (e.g., pumping and/or rutting) by the engineer should be undercut and replaced with structural soil fill or remediated at the geotechnical engineer's recommendation. Areas to receive structural soil fill should also be proofrolled prior to the placement of new fill.

### 4.2.2 Structural Soil Fill

Material considered suitable for use as structural fill should be clean soil free of organics, trash, and other deleterious material, containing no rock fragments greater than 6 inches in dimension. Preferably, structural soil fill material should have a standard Proctor maximum dry density of 90 pounds per cubic foot (pcf) or greater and a plasticity index (PI) of 35 percent, or less. The material to be used as structural fill should be tested by the geotechnical engineer to confirm that it meets the project requirements before being placed. The residual soils encountered in the soil test borings appear suitable for reuse as new fill; although, moisture conditioning may be required.

Structural fill should be placed in loose, horizontal lifts not exceeding 8 inches in thickness. Each lift should be compacted to at least 98 percent of the soil's maximum dry density per the standard Proctor method (ASTM D 698) and within the range of minus (-) 2 percent to plus (+) 3 percent of the optimum moisture content. Each lift should be tested by geotechnical personnel to confirm that the contractors' method is capable of achieving the project requirements before placing subsequent lifts. Areas which have become soft or frozen should be removed before additional structural fill is placed.

## 4.3 PRELIMINARY ENGNIEERING RECOMMENDATIONS

## 4.3.1 Shallow Foundations

The borings of this preliminary exploration typically encountered firm to very stiff residual soils. Preliminary consideration may be given to supporting structures having column loads of less than 200 kips on using a system of shallow foundations bearing in the stiff residuum. Shallow foundations are typically designed considering an allowable bearing pressure of 2,000 to 3,000 pounds per square foot (psf) to maintain settlements within an acceptable level. The allowable bearing pressure for design should be based upon evaluation of the proposed structural loads and estimated settlements which will require additional exploration and analysis.

Isolated zones of existing fill and soft residual soils were encountered which are unsuitable for shallow foundation support. Commonly, undercutting and replacement of unsuitable materials is performed to correct foundation support where relatively thin zones of unsuitable materials are encountered. We note that more extensive zones of soft soil may be encountered if significant earthwork cuts are performed. These extensive zones of soft soil are not easily correctable and deep foundations, or other alternative, may need to be considered if shallow foundation bearing elevations are established near where the more extensive zones of soft soils were encountered (12 to 32 feet below the existing ground surface).

The owner must be willing to accept the risk of sinkhole induced structural distress if the structure is supported using a system of shallow foundations. Given the estimated moderate to high sinkhole risk at this site, we recommend that consideration be given to measures to reduce the risk of sinkhole development, particularly if shallow foundations are used for structural support or significant earthwork excavation is proposed. A discussion of site design and earthwork grading, the injection of grout, and treatment of subgrades using cement to reduce the risk of sinkhole development are provided herein.

## 4.3.2 Deep Foundations

Heavily-loaded structures having column loads of more than 200 kips or more lightly-loaded structures supported on soft soils will require the use of deep, rock-bearing foundations for support.

Two commonly used deep foundation alternatives, drilled shafts and micropiles, are discussed herein.

A deep foundation system composed of drilled shafts (sometimes referred to as drilled piers or caissons) bearing in competent bedrock may be used to support heavily loaded structures or structures situated upon soft soil. Drilled shafts are typically installed by augering a hole to the top of bedrock, which is protected from collapse during drilling using a temporary steel casing. A socket is then advanced through the bedrock to expose hard, continuous materials. The typical socket diameter for drilled shafts ranges from 30 to 48 inches for the type of construction proposed. Once the socket has been formed in suitable materials, reinforcing is installed, and concrete placed as the temporary casing is removed. Once completed, the loads from the building superstructure are transferred to the underlying bedrock.

Micropiles are another deep foundation support alternative commonly used in this area. Micropiles are installed by drilling a steel pipe (i.e., casing) to the underlying bedrock surface. The hole is then extended, without casing through competent bedrock creating a socket (the pile bond length). Once the appropriate socket is penetrated (a function of rock quality and design bond strength), a steel reinforcing bar is centered in the casing which extends from the bottom of the socket to top of the micropile. Finally, the entire length is filled with grout using the tremie (bottom up) method. The typical micropile diameter ranges from about 5 to 9 inches. Using this method, the superstructure loads are then also transferred to the bedrock.

Rock coring to explore the bedrock was not conducted at this preliminary design phase as structural locations and types have not yet been determined. However, based on our review of the available geologic information and experience working in this area, the site bedrock most likely consists of dolomite and limestone. Drilled shafts are commonly designed considering allowable end bearing pressures of 75 to 100 kips per square foot (ksf) when bearing in hard, continuous dolomite or limestone. Micropiles are designed considering the bond strength between the hard, continuous dolomite or limestone which typically ranges from 75 to 100 pounds per square inch (psi).

The above values are for support of the deep foundations in hard, continuous bedrock. The bedrock

surface in this geologic setting is highly variable and weathered rock tends to overly competent bedrock, which may contain soil filled or open voids. It will be necessary to penetrate the upper weathered rock and void containing zones to reach the hard, continuous bedrock on which the deep foundations will bear. We note that the techniques used to install micropiles can more easily penetrate these zones of weathered or discontinuous bedrock and micropiles are anticipated to be the more favorable alternative at this site.

Once the building locations, finished grades, and anticipated foundation locations have been further refined, we recommend additional subsurface exploration be performed, including rock coring. The rock coring information will allow the development of the required deep foundation parameters for design and allow contractors to refine their cost estimates and help prevent construction phase cost overruns.

Structures supported using deep foundations bearing in the recommended materials will essentially eliminate the risk of sinkhole induced superstructure distress. The only portions of the structure which could be damaged by the formation of sinkholes after construction would be the lower level concrete slab-on-grade. The use soil cement modification in the structural areas would reduce the risk to the lower level slab, as discussed later in this report. The use of soil cement modification would also help to protect the building slab-on-grade subgrade during deep foundation construction.

## 4.3.3 Seismic Site Class Definition

The following discussion references the 2018 Edition of the International Building Code. Our evaluation of the site conditions is based on the borings of this preliminary exploration, as well as our previous experience on similar sites. Using this information, the average subsurface condition across the site most closely matches the description provided for "Seismic Site Class D" or "Stiff Soil Profile".

We anticipate the seismic site class definition will be a contributing factor to the overall cost of the project. It has been our experience that the seismic reinforcement and corresponding construction costs may be significantly reduced if a less conservative value for the seismic site class definition can be used for design (such as Site Class C). The use of SPT N-values to evaluate

the seismic site class is a conservative approach for evaluation of the seismic site class. A less conservative value can often be developed using geophysical methods to determine the average shear wave velocity of the subsurface materials. Once the structural locations have been further refined, we recommend the seismic site class definition be evaluated using less conservative, geophysical methods.

#### 5.0 SINKHOLE RISK REDUCTION

## 5.2.1 Site Design and Grade Selection

The proposed site is located in an area having a moderate to high potential for sinkhole development. It should be noted however, that the risk of sinkhole formation at this site is no greater than on other sites which have been successfully developed in Morristown. We are providing a discussion of general civil site design measures and soil improvement alternatives which may be used to help reduce the risk of sinkhole development.

The following are typical recommendations for civil site design in areas where there is a potential for sinkhole development:

- Locate structures away from areas identified as closed depressions or active sinkholes (none of which were identified based on our review of the available preliminary information within the proposed jail and justice center site).
- Limit site excavations to the extent possible and attempt to maintain a thickness of stiff residual soil or clay fill above the soft epikarst zone.
- Control surface and other waters which may infiltrate into the subsurface and aggravate sinkhole development.

It is recommended that excavations through the residual soil overburden at the site be limited to the extent possible. In general, the portions of a site that are excavated to achieve the desired grades will have a higher risk of sinkhole development than the areas that are filled, because of the exposure of relic fractures in the soil to rainfall and runoff. On the other hand, those portions of a site that receive a modest amount of fill will have a decreased risk of sinkhole development caused

by rainfall or runoff because the placement of a cohesive soil fill over these areas effectively caps the area with a relatively impervious "blanket" of remolded soil.

It is typically recommended that site grades be established to maintain a thickness of firm to stiff residual soil between the shallow foundation bearing elevation and the top of the soft epikarst zone of at least two times the anticipated foundation width, or greater, if shallow foundations are used for support. Maintaining this thickness of soil below the shallow foundation bottoms will prevent increasing the stress level in the soft epikarst zone.

Much can be accomplished to decrease the potential of future sinkhole activity by proper grade selection and through the establishment of positive site drainage. Although it is our opinion that the risk of subsidence associated with sinkhole formation cannot be eliminated; we have found that several measures are useful in civil site design and construction to reduce this potential risk. These measures include:

- Maintaining positive site drainage to route surface waters well away from structural areas both during construction and for the life of the structure.
- Verifying that subsurface piping beneath structures is carefully constructed and pressure tested prior to its placement in service.
- The use of pavement, concrete or geosynthetic clay lined ditches, particularly in cut areas, to collect and transport surface water to areas away from structures.

Considerations when building within a sinkhole prone area are to provide positive surface drainage away from proposed building or parking areas both during and after construction. Backfill in utility trenches or other excavations should consist of compacted, well-graded material such as structural soil fill or compacted dense graded aggregate. The use of an open graded stone (such as No. 57 stone) is not recommended unless the stone backfill is provided an exit path and not allowed to pond.

#### 5.2.2 Soil Cement Modification

Cement modification may be used as an alternative to help reduce the risk of sinkhole induced structural distress and has been used to mitigate sinkhole risk on several projects in the near vicinity

of the site. Cement modification entails the placement and mixing of Portland cement into the clay subgrade soils and re-compacting the material to 98 percent of the standard Proctor maximum dry density. Cement modification serves to stabilize, strengthen, and lower the permeability of the modified soil by way of a pozzolanic reaction which occurs between the calcium hydroxide released during hydration and alumina and silica in the clay soil. The resulting reduction in permeability effectively creates a soil-cement "cap" which helps reduce the potential for downward movement and infiltration of surface water; thereby, helping to reduce the potential for sinkhole development. The treated layer may also serve as a "bridge" which can arrest the upward migration of small dropouts which may develop beneath the treated zone. The owner must realize that cement modification reduces but does not eliminate the sinkhole risk.

The cement modification should result in a soil-cement modified zone of at least 20 inches in thickness, constructed in at least two lifts, within the area extending below the shallow foundation bearing elevation or the same thickness below the bottom of the deepest utility line trenches (including water, electric, etc.), whichever is deeper.

We recommend the program of soil cement modification be considered in the areas where structures are supported using shallow foundations, especially in areas of earthwork excavation. Soil cement medication may also be used to reduce the risk of lower level slab distress if the proposed structure is to be supported using deep foundations. If selected as a sinkhole risk reduction alternative, we recommend this program of soil cement modification be implemented within the entire area under the footprint of these structures. The area of treatment should also extend at least 10 feet beyond the building footprint in each direction.

Soil cement modification is best performed by specialty contractors familiar with this work. Cement modification is less costly as compared to grouting; however, the level of risk reduction is also likely less.

### 5.2.3 Cap and Compaction Grouting

A different technique to help reduce the risk of sinkhole formation in the building areas is the injection of grout into the subsurface. Cap grouting begins with the installation of steel casing to the top of

bedrock. The casing is then raised one to two feet and a low slump cement grout injected under pressure to fill voids at the bedrock surface and to create a "cap" on top of the bedrock. The cap of grout helps to reduce the potential for flushing or raveling of soil into open voids in the bedrock. Once the voids along the bedrock surface have been sealed and the cap created, additional grout can be injected while the casing is withdrawn to help to consolidate the soft soils within the epikarst and fill open voids within the soil, if present. This second grouting process is known as compaction (or consolidation) grouting. The compaction grouting is halted at some predetermined depth below the ground surface to reduce the potential for surface heave.

Cap and compaction grouting is performed by specialty contractors familiar with the process and geologic conditions in East Tennessee. Grouting has the advantage of treating the surface of the bedrock to reduce the potential of flushing or raveling of soils into voids within the bedrock thereby significantly reducing the potential for sinkhole development. While grouting will produce a lower risk of sinkhole development, this alternative is costlier and more difficult to quantify.

Given the higher cost of grouting, it is often recommended that a series of additional borings or geophysical testing be performed to identify areas within the proposed structural footprint which have a higher potential for sinkhole development. These are typically areas of deep, soft residual soils (referred to as "slots"), such as encountered in boring B-7 of this exploration. At this site, the geophysical method would likely consist of Electrical Resistivity Imaging (ERI). Electrical resistivity surveying is a geophysical method in which an electrical current is injected into the earth; the subsequent response (potential) is measured at the ground surface to determine the resistance of the underlying earth materials. The ERI is performed along arrays (lines) at the ground surface within the area to be explored.

ERI is often used in this geologic setting to explore for indications of karst (sinkhole) conditions. Upon completion of the geophysical testing, the grouting would then be performed within areas identified as having a potentially higher sinkhole risk, instead of grouting the entire building footprint, thereby lowering the overall cost of the cap and compaction grouting program.

## 6.0 DIFFICULT EXCAVATION

The borings of this exploration encountered auger refusal at depths of 29.2 to 66.7 feet below the existing ground surface without encountering auger refusal. Auger refusal conditions generally correspond to materials which require difficult excavation techniques (pneumatic hammers or blasting) for removal. Typically, soils penetrated by augers can be removed with conventional earthmoving equipment. However, excavation equipment varies, and field refusal conditions may vary. Generally, the weathering process is erratic and variations in the rock profile can occur in small lateral distances, particularly in this type of geology, as can be seen with the refusal depths of the preliminary phase soil test borings.

Based on our understanding of the conceptual phase project information, excavation difficulty is not anticipated to be a significant project concern. We recommend additional exploration be performed once site grades have been developed to explore for the presence material which may present excavation difficulty.

## 7.0 REQURIED ADDITIONAL GEOTECHNICAL EXPLORATION

This exploration is preliminary in nature and should be used for general site planning and feasibility evaluation only. Due to the relatively limited information available at this preliminary stage of the project, preparation of a complete report of geotechnical study with specific recommendations for foundation design and site preparation will require supplemental exploration and analysis. Project details and performance criteria should; however, be initially further developed. As project details are developed, additional exploration, field and laboratory testing, and engineering analysis will be required.

The geotechnical engineer should be retained to consult with the designer during design development, design and construction phases such that the recommendations of this preliminary report are properly interpreted and further developed as necessary.

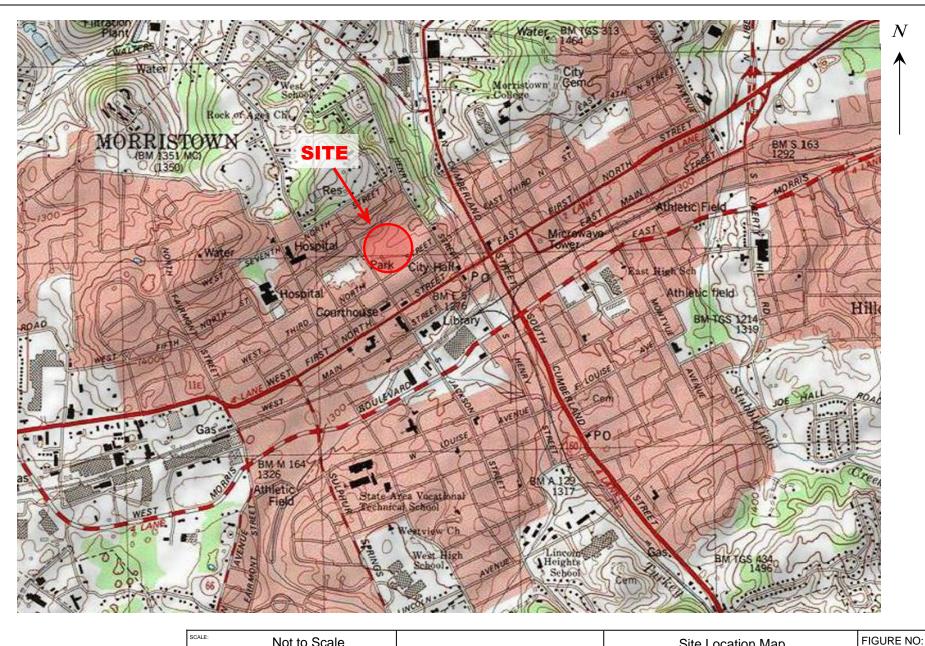

## 8.0 LIMITATIONS

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. This report is for our geotechnical work only, and no environmental assessment efforts have been performed. The conclusions and recommendations contained in this report are based upon applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.

The analyses and recommendations submitted herein are based, in part, upon the data obtained from the exploration. The nature and extent of variations between the borings will not become evident until construction. If variations appear evident, then we will re-evaluate the recommendations of this report. In the event that any changes in the nature, design, or location of the structures are planned, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed, and conclusions modified or verified in writing.
